NATURE-BASED SOLUTIONS

International Guidelines on the Use of Natural and Nature-Based Features for Flood Risk Management

To advance our use of nature-based solutions, Mississippi Valley Division is now USACE's latest Engineering With Nature proving ground. EWN is the intentional alignment of natural and engineering processes to efficiently and sustainably deliver economic, environmental and social benefits through collaboration.

NATURE-BASED SOLUTIONS

Key Messages

1. Past modifications of rivers and their basins have increased the risk of flooding. Climate change, anthropogenic features, and land use changes have increased the stress on natural fluvial systems and their functions, asserting more pressure on flood risk management infrastructure.
2. Natural and nature-based features (NNBF) help mitigate these impacts, reducing both the level of flood risk and our dependence on engineered flood control structures while also restoring the natural environment, providing societal and ecological co-benefits.
3. As the benefits of NNBF are realized, more people are likely to see these benefits and want NNBF implemented in their watersheds. Monitoring and adaptive management of NNBF are needed to demonstrate the added benefits.
4. Adhering to the five fluvial NNBF general principles is key to ensuring sound fluvial applications.

Principle 1 – Use a Systems Approach to Leverage Existing Components and Projects and Their Interconnectivity

Principle 2 – Engage Communities, Stakeholders, Partners, and Multidisciplinary Team Members to Develop Innovative Solutions

Principle 3 – Identify Sustainable and Resilient Solutions That Produce Multiple Benefits

Principle 4 – Anticipate, Evaluate, and Manage Risk in Project of System Performance

Principle 5 – Expect Change and Manage Adaptively

ANCHORED OR LOCKED LOGS

SUMMARY: Place woody debris to create fisheries habitat.

HABITAT CRITERIA: Anchored or locked logs provide refuge/shading for fish and enhances substrate diversity for macroinvertebrate growth and development in support of other wildlife goals.

DESIGN CONSIDERATIONS:

1. Logs should be 30 feet (minimum) in length to 100 feet.
2. Live trees cleared for other features are optimum. Using trees with multiple branches provides better habitat.
3. Anchored logs can be bunched in groups of three perpendicular to the bankline. These should be double clamped.
4. Trees need to be submerged (trunk should be allowed to go to flat pool), but cabling should also allow for varied water elevations and not pull the anchor from the ground.
5. For locked logs in shoreline protection, embed with 3 feet of riprap minimum for cover, and about 15 feet of the tree to be covered (roots at bankline, branches into water). These logs can be angled downstream 45 degrees from the bankline.
6. If combining locked logs with bankline protection it is crucial that bankline protection is tied back into the bankline (10 to 50 feet) to prevent the protection from unzipping during flood events.
7. Clamps and ballasts or stone to lock in.
8. Multiple stems for diversity, as many branches as possible.
9. When using metallic features, consider recreation and safety in the design.

PARAMETRIC COST TAB(S):

Environmental Design Pamphlet

Woody Bundles: Installing separate woody bundles in pools or incorporating wood into stone structures dissipate flow energy, resulting in channel stability and improved fish habitat. Bundles provide refuge and enhances substrate diversity for macroinvertebrate growth in support of wildlife goals.

BUILDING STRONG®

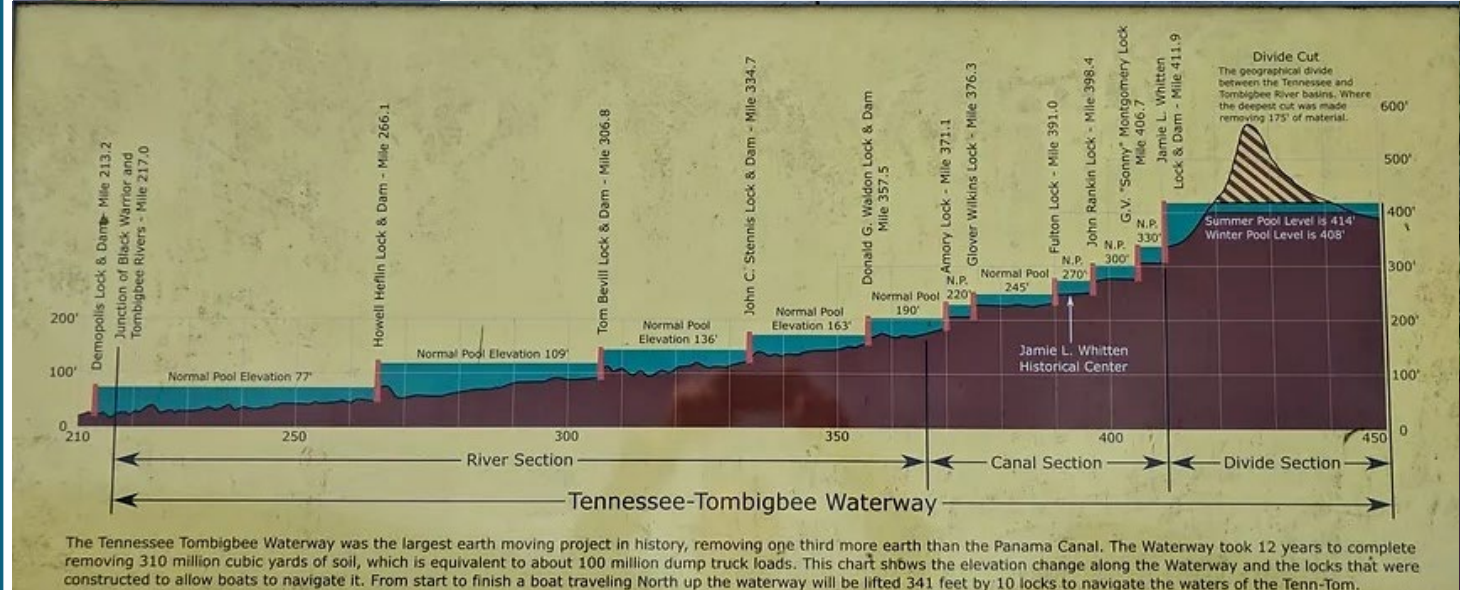

TENNESSEE-TOMBIGBEE WATERWAY

Key Facts

- Opened January 1985
- Connects the Tennessee River to the Tombigbee River via a 29-mile-long (47 km) channel cut across the terrain dividing the two watersheds
- 234 miles (377 km) long, 300 feet (90m) wide by 9 feet (3m) deep transportation artery
- 10 locks, each measuring 110 feet (34m) by 600 feet (183m), providing a lift of 341 feet (104m)
- Shortened shipping distances for many inland ports by over 800 miles (1287 km)
- 150 million cubic yards of earth had to be removed, about 1.5x more than for the Suez Canal.

TENN-TOM WATERWAY CANAL SECTION

12

46-mile canal section
authorized to 12-foot
draft and 300-feet
wide with 5 locks

TENN-TOM WATERWAY RIVER SECTION

13

The Tombigbee River forms in northeast Mississippi and flows southeastward where it converges with the BWT near Demopolis, Alabama.

149-mile river section authorized to 9-foot draft and 300-foot width containing 4 lock and dams.

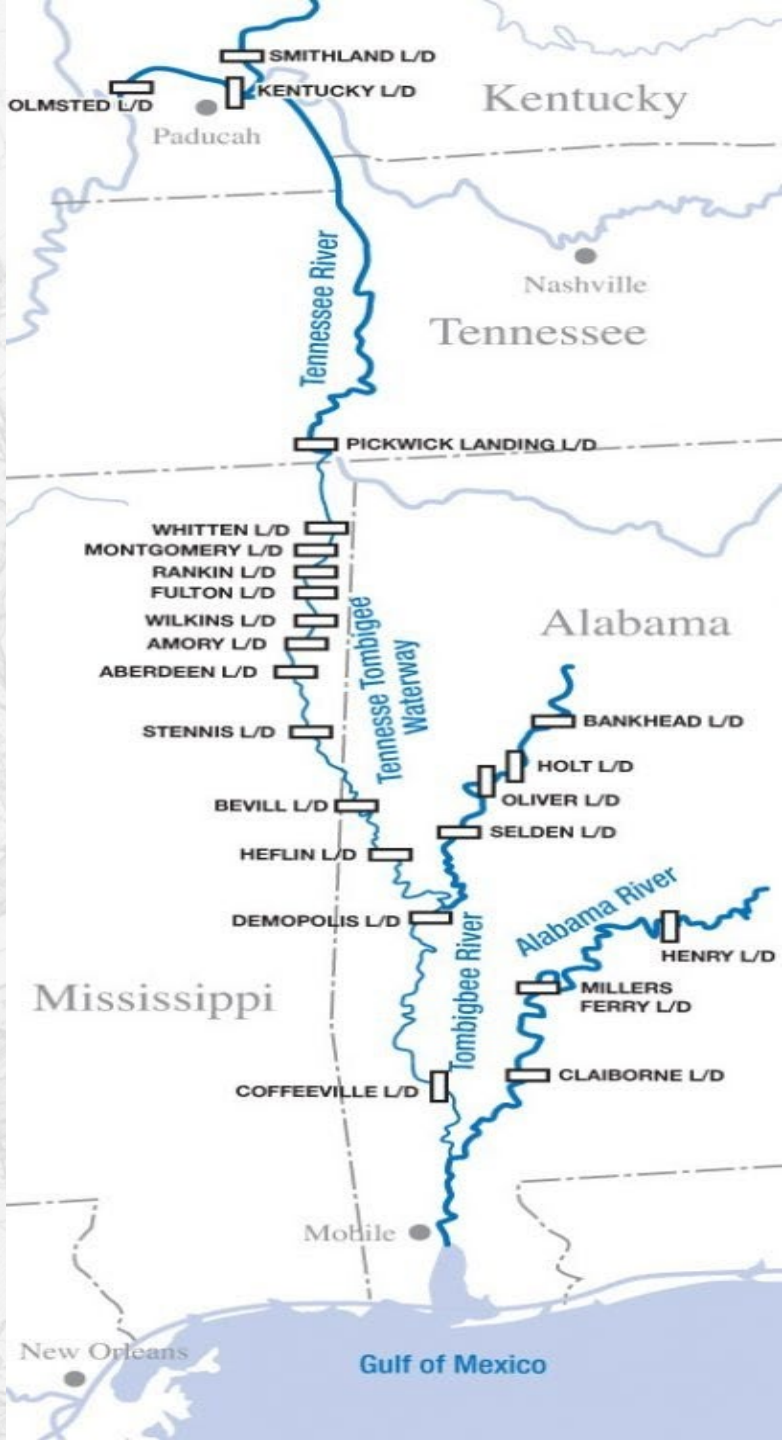

TENN-TOM LOCK CAPACITY

- **Authority:** Section 216 of Flood Control Act of 1970, as amended, P.L. 91-611
- **Original Navigation Channel Construction Authority:**
 - BWT – authorized by various River & Harbor Acts, 1884 – 1986.
 - TTWW – authorized by River & Harbor Act of 24 July 1946 (H. Doc. 486, 79th Cong., 2nd Sess.)
- **Waterborne Commerce**
- 6.4 million tons (FY28-22 average)

Lock (south to north)	Commercial Lockages Yearly Avg FY20 - 22	Usage of Lock* (%)	Date in Service
Heflin	1,167	13%	1978
Bevill	1,189	14%	1979
Stennis	1,277	15%	1981
